

QUILLANCE | CLOUD COMPUTING BEGINNER PROJECT

Deploy a Static Portfolio Website on the Cloud

Responsive website | GitHub version control | Cloudflare Pages

Submitted by Akash Ranjan Swain

B.Tech, Computer Science and Engineering | Centurion University of Technology and Management

DOMAIN

Cloud Computing

HOST

Cloudflare Pages

Desktop homepage showing the portfolio hero & navigation.

PROJECT OBJECTIVE

I designed a responsive one-page portfolio, stored the source with Git and GitHub, and published it as a public HTTPS website using Cloudflare Pages. The final static site presents my profile, skills, academic projects and contact details without a backend or database.

LIVE WEBSITE

<https://personal-portfolio-e5p.pages.dev>

GITHUB REPOSITORY

<https://github.com/BOT-AK4SH/personal-portfolio>

CLOUD DEPLOYMENT FLOW

Local files > Git commits > GitHub > Cloudflare Pages > HTTPS website

Website Design and Responsive Layout

IMPLEMENTATION AND EVIDENCE

BUILD APPROACH

- HTML sections with anchor navigation.
- Responsive CSS variables, spacing and a mobile media query.
- JavaScript hamburger menu for smaller screens.
- Red-arch hero, cream sections and teal accents.

TOOLS AND CONTENT

- HTML, CSS, JavaScript, Google Fonts and Chrome DevTools.
- Git and GitHub for history and README documentation.
- Projects: Amazon Lex chatbot and AWS EC2 web server.
- Home, About, Skills, Projects, Contact and Footer.

DESKTOP AND MOBILE EVIDENCE

Complete mobile & desktop sequence, hero and mobile open hamburger navigation.

ACTUAL PROJECT STRUCTURE

index.html | css/style.css | js/script.js | images/ | README.md

GitHub Version Control and Cloudflare Pages

REPOSITORY AND DEPLOYMENT

Local project > Commit > Push to main > Cloudflare build > HTTPS live

The public repository stores the website files and commit history. Cloudflare Pages is connected to the main branch with no framework or build command because the deployable static files are already in the repository. Each future push can trigger an automatic deployment.

DEPLOYMENT EVIDENCE

GitHub repository & Cloudflare Pages configuration.

Testing, Challenges, Learning and Conclusion

FINAL TESTING CHECKLIST

TEST	EVIDENCE	STATUS
Public URL	HTTPS page opens externally	PASS
Desktop layout	Hero, sections and footer display	PASS
Mobile layout	Checked at 375 x 667	PASS
Mobile menu	Opens, closes and shows all links	PASS
Navigation	Anchors reach the correct section	PASS
External links	Project and contact links checked	PASS
Assets	CSS, fonts and hero image load	PASS
Page behaviour	No horizontal scrolling or CSS errors	PASS

CHALLENGES AND RESOLUTIONS

Mobile navigation Added a hamburger button, stacked menu and small JavaScript toggle.	CSS validation Found a missing semicolon, corrected it and cleared the editor errors.
Cloudflare connection Reinstalled the GitHub App and limited access to this repository.	Git synchronization Resolved the README merge conflict, completed the merge and pushed.

LEARNING OUTCOME

I learned how a static site moves from a local folder to a Git repository and then to a cloud platform. I also practiced responsive design, meaningful commits, deployment configuration, HTTPS testing and basic Git conflict resolution.

CONCLUSION

The final portfolio is responsive, public and served over HTTPS. It contains the required Home, About, Skills, Projects and Contact sections, includes two academic projects, and can be updated automatically through future pushes to the main branch.
